Incoming Goods Checks

Before the acceptance of incoming goods the following checks are carried out:

- The person receiving the (Bio & Global G.A.P. CoC certified) goods is responsible for checking the purchase order, product description, variety, and quantity against the delivery documents by completing an inspection report in the ERP system. In this inspection report, the supplier name, address, delivery number and date of receipt are recorded, and the product description including any reference to Bio and/or Global G.A.P. CoC is verified. During this check, the condition of the transport vehicle is inspected for pest management purposes and each individual tray or pallet is labelled with the lot number, quantity and size to ensure correct identification. All batches are marked with green (approved), yellow (requires inspection or adjustments), or red (rejected) cards.

- Flowerbulbs (Bio & Global G.A.P. CoC certified) traded in the EU must be provided with a valid BKD / EU Plant passport number indicating that the flowerbulbs have been grown in the EU and have been assessed by official (independent) inspectors and classified by variety. Moolenaar does not trade flowerbulbs that do not have a valid EU plant passport number. Suppliers are always approved by our customers beforehand.

Storage and Maintenance

All goods are stored under controlled conditions in designated storage areas.
Each variety has its own section for storing, with Bio & Global G.A.P. CoC certified products stored separately in a specially reserved room.

A maintenance company is contractually responsible for the upkeep of temperature-controlled storage cells. Any faults are automatically directed to a 24/7 emergency service. Maintenance and service activities are logged in the Production & WMS / Technical Service maintenance log.

Non-conforming & Rejected (Bio & Global G.A.P. CoC) Flowerbulbs

Rejected batches are recorded in our ERP system and assigned a unique batch number and marked with a rejection document. They are stored in a seperate location from healthy bulbs until they are collected by the owner or destroyed. These batches remain untouched until their disposition. Associated documentation, such as batch cards, are also destroyed.

Where a rejection occurs, Sales & Marketing / Purchasing is informed. They a determine the appropriate course of action in consultion with the grower. This may include returning the bulbs without replacement, returning them with replacement delivery, or allocating costs to the grower. Sales & Marketing / Purchasing is responsible for contacting and coordinating directly with the supplier.

Products that are ordered with a Global G.A.P. claim but are delivered without the CoC number or GGN of the supplier in the sales documents or delivery note, and / or which fail the input / output verification, must be immediately provided with a new label indicating that they are non-certified products and must be handled and processes as non-certified products.

If a problem may affect the Global G.A.P. certification status or the integrity of the product, our certification body (Control Union) must be informed immediately.

Although Moolenaar does not apply plant protection products, any potential issue related to residue exceedance or any other exceedance of applicable legal limits is treated as a non-conformity originating from the supply chain.

In such cases the following applies:

- The affected batch is immediately identified and placed on hold in the ERP system.
- Full traceability is used to identify the supplier and production batch.
- An investigation is initiated without delay to determine the cause of the issue.
- The supplier is informed and requested to provide clarification, supporting evidence and corrective actions. Where the supplier is not the original producer, the original producer shall also be informed and involved in the investigation and corrective action process.
- All relevant communication, investigation results, and actions are documented and maintained in accordance with our procedure for Recall & Traceability (Global G.A.P. CoC).
- Products intended for different destination countries are assessed against the applicable legal requirements, including Maximum Residue Limits (MRL) and any other relevant import requirements of the respective destination market.
- The batch is only released if compliance with all applicable legal requirements for the intended destination country can be demonstrated.

- If required by legislation, certification requirements, or risk assessment, the Certification Body (CI) and / or competent authorities shall be informed without delay.
- Corrective and preventive actions may include supplier corrective actions, additional testing, increased monitoring, temporary suspension of supply or supplier disqualification in case of repeated issues.

Pre-Production Checks

Before production, flowerbulbs are re-inspected when removed from storage.
Any quality issues or defects at this stage are handled as non-conforming material and processed according the last section.

Skal Compliance

The share of organic products at Moolenaar is small, amounting to 3 to 5 deliveries per year. In therms of the number of bulbs, this is less than 0.2%.
Sales & Marketing / Purchasing requests the organic certificate from the grower, which is passed on to QHSE. QHSE verifies its validity and saves it, cross-checking with the Skal website to ensure data consistency.

If there is a suspicion that organic products do not comply with legislation, Skal is informed through the "Mijn Skal" website. This ensures regulatory complaince and quality assurance throughout the handling process.
