This procedure sets out how to deal with notifiable and serious outbreaks of pests and diseases, which include the following measures.

Our building is checked monthly for pests by Attack.
This is a legal requirement according to HACCP.

Attack specialises in preventing, repelling, and controlling many types of pests to prevent plagues and outbreaks of diseases.

If a pest or disease breaks out outside the control round, we should immediately call Attack for an additional check.

In the event of an outbreak of a pest on the bulbs, for example lice. This will immediately become apparent upon arrival from the grower during the incoming goods check. These bulbs are immediately stored separately outside the building or destroyed if the grower does not want these bulbs back for inspection. The grower will be informed about this by our Purchaser.

In the event of a non-transmissible disease, the bulbs will be stored in a specially designated area so that they are isolated until Purchaser has indicated what may be done with them.
In the event of rejection, a thumbs down card is given so that this is recognisable and cannot be accidentally included in further production.

Despite our aim to keep the building as clean as possible, the chance is certainly present that unwanted insects and other pests enter our premises. Pests can easily be taken into our building in one of the numerous deliveries of material. Also when the weather changes, there is a chance that pests will seek a place to survive at Moolenaar.

If this happens during storage, they will be immediately destroyed and Attack will visit to combat this.

In the event of a serious outbreak, we will have to check NVWA to see what actions we should take.

Customers will be notified if this jeopardises their order. Other solutions will be looked at so that the customer still receives what he or she ordered.

External Area Maintenance

At Moolenaar, all areas surrounding the facility must be kept clean and well-maintained to prevent pest activity and protect our products.

To support this, we have created the Green Team - a voluntary group of employees who enjoy working outdoors and help maintain the garden, entrance, and outdoor areas when their main tasks are complete. One of their key roles is keeping grass, shrubs and other vegetation trimmed to prevent potential pests.

In addition, external areas must be kept free from waste, unused materials and anything that could provide shelter for pests. Regular inspections of the building are carried out to identify and seal any openings that could serve as entry points.

The Green Team plays a valuable role in maintaining a tidy, welcoming exterior while directly supporting our pest prevention efforts.

Insects

The actions taken for flying insects are described in our Company Risk Assessment.

Mice

Mice traps are set up in consultation with Attack.
Our Lead - Quality control live material will check regulary whether mice have been caught / killed. These mice are immediately removed. If no mouse has been caught for 4 days, this check can be stopped. This data is discussed with Attack during their next visit. If the plague worsens, Attack will be contacted by us.
Mice and rats must be controlled from the first observation.
