Damaged Products

Glass can be a hazardous material that must be handled and processed with care. To prevent unnecessary injuries to employees, customers, and consumers, various requirements are imposed on the production of glass. Glass products must be manufactured according to specific specifications.

- Pallets and packages are examined in detail. As agreed, several samples are taken, assessed by Sales & Marketing / Product Development & DTP, and measures to ensure the product meets the required specifications.
- Unpacking glass products should be conducted with caution and care.
- During production, permanent employees continiously monitor the process.
- The production and On-Line Checklist is signed as agreed. Occasionally, QHSE personnel and head of departments will verify that products meet their specifications.
- If there is a suspicion that a product has been damaged during transport or contaminated, an order will be issued to unpack the products and check for damage, breakage, and contamination.
- Employees will be informed that the product must be unpacked. There is always a risk that pottery and glass pots may break during transport and unpacking. This sorting should occur at a safe distance from the final product. Unpacking must always be done while wearing gloves.
- Rejected items should be set aside immediately to prevent any errors.
- It is virtually impossible for breakage or contamination to occur during production. However, if this does happen, production will be halted immediately to remove the damaged products. All intact products will be carefully removed from the workplace.
- Damaged products must be recorded, counted, and placed in a designated waste bin or container. It is strictly prohibited to dispose of glass in waste bins other than the designated ones.
- Once the rejected items have been removed, the production line must be cleaned thoroughly. Production may only restart after all glass remnants have been completely removed and the surrounding area has been inspected for shards and splinters.
- An incident log must be completed and signed off before packing can resume.

- A final check will be conducted by the department manager.
- Production can then be restarted.
